

EXPLORATION THROUGH RESEARCH

- Since the last time you wrote about your research, what did you find out? Did your driving question or topic change? Why or why not?
- Now that you are in the "student-led research" part of the process, which student-led research option are you doing? (Survey, interview of an expert, observation, or experiment) Why?
- What has been easy and what has been difficult about this process?
- In your next steps, what do you need to do to make sure you successfully complete this component of the project? What are some things you need to do?
- How is your collaboration going so far? What is working well and not working well?

I found out , that we needed to change our topic in order to find out a perfect driving question. I am doing an interview, because for brain psychology, it would be difficult for students to do a survey as most of them do not know in what way to respond to them. A professional in the department of psychology was perfect for our interview as our topic is about the mental skills that athletes need to become better at their sport. We have been able to manage our symposium project pretty well and we hope that the rest of the project will be the same amount of stress free work if we manage our time good and use it efficiently. The easiest part, I think will be sending the email to the professor and asking him to answer our questions. The only parts that I need to finish, are the poster tri-fold board and pasting the information onto the board.
